

JavaScript Execution Flow: processTeaOrder(makeTea)

1. JavaScript scans the entire code before running and hoists function declarations.
2. Function 'makeTea' and 'processTeaOrder' are now available to be called.
3. Execution starts at line 9: `console.log(processTeaOrder(makeTea))`
4. `processTeaOrder(makeTea)` is called.
 - Argument passed: `makeTea` (a function) is received as `teaFunction`.
5. Inside `processTeaOrder`: `teaFunction("earl grey")` is executed.
6. `makeTea("earl grey")` is called.
 - `typeofTea = 'earl grey'`
 - Returns: `'makeTea : earl grey'`
7. The return value goes back to `processTeaOrder`, which returns it to `console.log`.
8. `console.log` prints: `'makeTea : earl grey'`
